

DATA ANALYSIS PROJECT PROPOSAL

Project Title :

Airbnb Booking & Pricing Strategy Analysis

Team & Roles :

Jai Surya Prabhakaran(team leader)– Data Analysis & Documentation

Divya Bharathi Selvam- Data Collection,

Surya Prakash Nidamanuri – Visualization, Reporting

Introduction (dataset based) :

This project analyses the Airbnb listings dataset, which contains information about property types, prices, locations, amenities, availability, and customer review ratings. The objective is to explore how these factors influence Airbnb listing prices and overall listing performance. By analysing patterns in the data, the project aims to identify key characteristics associated with higher-priced and better-rated listings. The findings can provide useful insights for Airbnb hosts and property managers when making pricing and listing improvement decisions.

Problem Statement (dataset based) :

Airbnb hosts face challenges in determining competitive pricing for their properties because multiple factors, such as location, property type, amenities, and customer reviews, can affect listing performance. However, the extent to which these factors influence pricing is not always clear. This project aims to analyse Airbnb listing data to identify the key factors associated with pricing variations and better-rated properties, helping hosts make more informed decisions.

Business Questions :

1. What factors influence Airbnb pricing?
2. Which neighbourhoods and cities have the highest average prices?
3. How do customer reviews relate to listing prices?
4. What property types perform best?
5. Does Instant Booking affect pricing and ratings?
6. Which amenities are associated with higher-priced listings?
